HowTo Run DotNet Core App as Standalone

How to startup a net core application and specify the listening IP address and port:

```
exename.exe run --urls "http://192.168.1.110:6000"
```

Here's an alternate for starting a service that exists as a dll:

```
dotnet OGA.HostControl.Service.dll --urls http://192.168.1.110:6000
```

If the process requires more than one listening url, do this:

```
dotnet OGA.HostControl.Service.dll --urls http://192.168.1.110:6000;http://172.17.0.1:4180
```
