RunDeck Backups

Adapted from here: https://docs.rundeck.com/docs/administration/maintenance/backup.html

We will use the rd tool to access the RunDeck API and export the project job list.

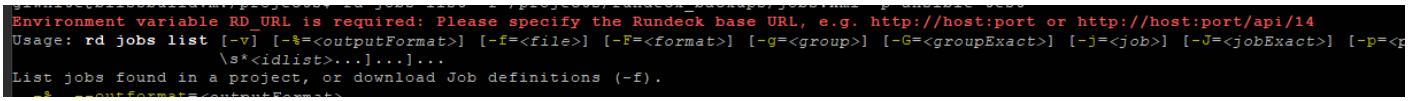
We will be backing things up to this folder:

```
/projects/rundeck_backups
```

1. Execute this, to export the project and job list:

```
rd jobs list -f /projects/rundeck_backups/jobs.xml -p ansible-test
```

If the above command returns this error, you need to set the environment variable:



If so, set this variable:

```
export RD_URL=http://192.168.1.200:4440
```

2. Stop the server:

```
sudo systemctl stop rundeckd.service
```

3. Backup the database:

```
sudo cp -r /var/lib/rundeck/data /projects/rundeck_backups/data/
```

4. Copy the logs:

```
sudo cp -r /var/lib/rundeck/logs /projects/rundeck_backups/logs/
```

5. Start the server:

```
sudo systemctl start rundeckd.service
```
